ZoneRun needs a Bluetooth FTMS treadmill and heart rate monitor to run a workout. This guide shows every feature using the app's demo data so it can be reviewed without that hardware.

What ZoneRun does

ZoneRun is a heart-rate-zone trainer for Bluetooth treadmills. The runner picks a workout made of heart rate zones and ZoneRun controls the treadmill belt so their heart rate stays in the zone for each step.

- Hardware: an FTMS (Fitness Machine Service) Bluetooth treadmill and a Bluetooth heart rate monitor.
- Without hardware you can browse and build workouts, edit heart rate zones and view the Profile tab.
- Every screenshot in this guide comes from the app's built-in demo data (debug builds only). The App Store build contains no demo data.
- No accounts, no sign-in, no servers. All data stays on the device and in Apple Health.

Connecting devices

The Run tab shows the treadmill and heart rate monitor. Connect devices scans for nearby FTMS treadmills and heart rate monitors; ZoneRun reconnects to the last used devices automatically on the next launch.

- Bluetooth is used only to talk to the treadmill and heart rate monitor.
- ZoneRun sets target speed and incline through the FTMS control point.
- The heart rate monitor can be a chest strap, arm band or any standard Bluetooth HR sensor.

First calibration

Before the first workout, ZoneRun needs to learn how fast the runner goes in each zone. Workouts stay locked until the calibration run is complete.

- Calibration is a 25 minute run: 5 minutes in each zone, from zone 1 to zone 5.
- The average speed over the last 3 minutes of each zone becomes that zone's start speed.
- The Workouts tab explains why it is locked and where to start calibration.

Calibration required

Workouts locked

Calibration run and results

During calibration ZoneRun steers the belt to each zone in turn. At the end it shows the old and new speed for every zone and saves the run to Apple Health.

- A weekly calibration keeps start speeds up to date as fitness changes.
- Hill running is grade-adjusted, so incline never skews the calibrated flat speeds.
- Calibration can be restarted from the Profile tab after an injury or a long break.

Calibration complete

Building workouts

Workouts are made of blocks. A block runs once or repeats, and each step has a zone, a duration and an optional incline.

- The coloured bar previews every step: height and colour show the zone, arrows mark hills.
- Blocks and steps can be reordered by dragging.
- Six sample workouts are included; runners can edit them or create their own.

Hill repeats editor

GPX routes

A workout can follow a GPX route. ZoneRun reads the elevation profile and updates the treadmill incline every 10 seconds to match the next 100 m of the course.

- The live map shows progress along the route; it is a visual guide only.
- Location is never used, and no GPS or route data is written to Apple Health.
- When the incline changes, belt speed is grade-adjusted so effort stays in zone.

Route attached to a workout

Running a route

Live run and automatic speed

The live screen shows the current step, the step after it, heart rate against the zone target, and speed, incline, time, distance, climb and energy.

- Auto speed nudges the belt up or down in small steps when heart rate leaves the zone.
- Every second ZoneRun checks the belt speed and corrects it if the treadmill drifted.
- The runner can always override with the minus and plus buttons or the treadmill's own controls.
- Pause stops speed control immediately; End finishes and saves the run.

Zone intervals, step 5 of 12

Pause and safety

ZoneRun never fights the treadmill's safety systems. If the belt stops, the safety key is pulled or the treadmill disconnects, speed control stops until the runner resumes.

- A clear banner explains why the run paused.
- ZoneRun only sends speed changes while a run is active and not paused.
- The treadmill's own stop button and safety key always take priority.

Safety key pulled

Profile and progress

The Profile tab charts grade-adjusted speed per zone over time, so runners can see their fitness improve, along with recent runs and calibration history.

- Charts can show 4 weeks, 3 months or all history.
- Recent runs list distance, duration, average speed and climb.
- Calibration history shows each zone's current start speed.

Speed per zone

Calibration history

Heart rate zones

Zones are based on maximum heart rate and can be fine-tuned zone by zone.

- Set a maximum heart rate and reset all five zones from it.
- Adjust the low and high limit of each zone individually.
- Zone limits drive auto speed, calibration and the live heart rate display.

Heart rate zones

Voice coaching

Spoken cues let runners keep their eyes off the screen. Other audio, such as music or podcasts, is lowered while a cue plays. Cues can be muted from the live screen.

- Step changes, with the zone and speed of the next step.
- A countdown before each step ends.
- Hill and incline changes, and each kilometre split.
- Speed changes made by auto speed, and pauses or disconnections.

 Next: Zone 4 at 11.4 km/h, 3 minutes.

 Hill ahead: 6 percent.

 2 kilometres. 12 minutes 10.

 Speeding up to 10.3 km/h.

Apple Health and privacy

ZoneRun saves each finished run to Apple Health as an indoor running workout. It asks for Health permission only when the first run starts.

- Writes: workout, heart rate, walking and running distance, running speed and active energy. Climb is saved as the workout's elevation ascended.
- Reads: workouts only, so runs are saved correctly.
- Location: never requested. GPX routes set the incline only; no route or GPS data is saved.
- No account, analytics, ads or network requests. Settings and history stay on the device.
- Background modes: Bluetooth, to keep controlling the treadmill with the screen locked, and audio, for voice cues.
